

# Partial Street Closure

A partial street closure requires a barrier to block vehicular movements for one direction of the intersection, essentially creating a one-way street on one of the approaches. The closure can be for traffic entering or exiting the intersection.

## Typical Use

- Partial street closures should only be used on local roads and at intersections.
- Partial street closures can be used on streets with any common urban speed limit, provided that there is adequate advanced warning.

## Design Features

- The partial street closure may be constructed using a landscaped island, bollards, or wall.

## Further Considerations

### *Advantages*

- Reduces cut through traffic.
- Reduces vehicle speeds by narrowing the pavement width.
- Emergency vehicle access is not restricted as they can maneuver around the partial street closure.

### *Disadvantages*

- A traffic study may be required to analyze the effects of vehicle rerouting.

## Materials & Maintenance

Signage and pavement markings shall be designed per local standards.
